01 / FROM REFERENCE TO PLAYABLE PROTOTYPE

A familiar loop. A different world.

A compact fishing incremental built around visible automation and measurable pacing.

01 THE BRIEF

Create an HTML incremental prototype inspired by Life of Ants, with a clear economic loop and 5–10 minutes of guided play.

02 REFERENCE STUDY

Codex-assisted inspection helped verify resource values, upgrade prices, construction timers and unlock rules.

WHY FISHING?

01 NATURAL LOGISTICS

Fishing grounds, boats and harbors translate the collect-and-deliver loop directly.

02 VISIBLE AUTOMATION

Worker boats turn spending into observable, growing production.

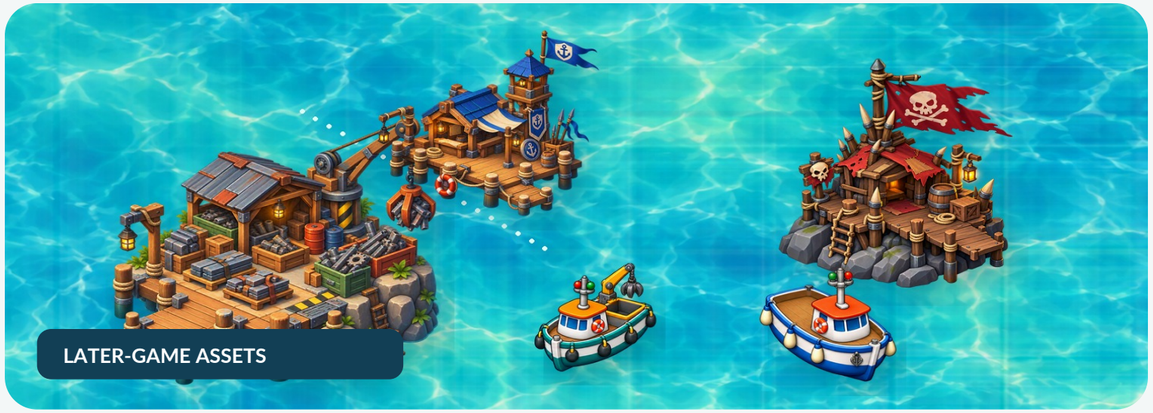

03 ROOM TO EXPAND

New waters make higher-value fish, pirates, defense and salvage feel natural.

PROCESS Reference analysis → Game systems & economy → Codex-assisted build → Simulation & playtests

Built to teach. Designed to grow.

The first session establishes the loop; the second territory adds new economic decisions.

PROGRESSION

01 **FISHING BAY**
Catch, deliver, upgrade the boat and hire workers.

02 **PIRATE WATERS**
Higher-value resources, defense, shipwreck salvage and metal.

BALANCE & VALIDATION

15	~10m	34
CORE QUESTS	TO ZONE 2	TOTAL QUESTS

FAST pacing was tuned using automated progression simulations and real playtests with event analytics. REFERENCE preserves a comparative economic profile.

EXPANSION PROPOSAL

Automated Fishing Stations

Spend salvaged metal to convert older fishing grounds into stations that generate income directly. Boats are freed to work higher-value waters.

OLD FISHING GROUNDS → SALVAGED METAL → PASSIVE INCOME

MOBILE EXTENSION • Offline earnings from boats and stations, with an optional rewarded multiplier on return.
